

Open Source Technology is a term borrowed from the world of computer programming. It means that the original idea/design/development work on a tool or product is made public for others to develop further. The developments/improvements are then fed back into the system for others to benefit from. At each stage of development credit for the work is retained by each of the developers.

Any improvements in design must be tested and demonstrated by empirical evidence and data, then peer reviewed before acknowledgement will be given.

Anyone may leave a comment at the end of any article, and download any plans that are associated with the article. In time there will be a forum for further discussions.
